

SUBSCRIPTION PERFORMANCE | DROP-OFF ANALYSIS

Subscription Performance & Drop-off Analysis

Business Analysis Report | September 2026

1. Executive Summary

The September 2026 dashboard shows a healthy subscription base, with 32,958 users and ₹19.85 lakh in recorded revenue. The overall conversion rate is 38.8%, while 38.2% of users are returning users. The main opportunity is not user acquisition alone; it is improving the journey from initial engagement to successful payment.

The largest visible funnel loss is between app open and paywall view, followed closely by paywall to plan selection. At the same time, payment performance is comparatively strong: UPI has the highest success rate at 86.6%, while Net Banking is the weakest at 79.5%. These results suggest that the first priority should be reducing early-stage journey friction, followed by targeted payment experience improvements.

Management takeaway

Focus first on the early subscription journey. A small improvement before and around the paywall can affect a much larger user pool than a narrow optimisation at the final payment step.

2. KPI Snapshot

Total Users	Total Revenue	Successful Payments
32,958	₹19,84,716	3,882
Overall Conversion	Value at Risk	Returning Users
38.8%	₹4,16,695	38.2%

3. Dashboard View

4. Funnel & Drop-off Findings

The funnel starts with 32,958 app opens and narrows through paywall view, plan selection and payment. The dashboard shows the biggest stage-level drop-off at the early part of the journey. This is important because users lost early in the journey never reach the stages where the business can convert them.

The conversion-by-stage view shows that the final payment step is relatively healthy compared with the earlier stages. In other words, the data points more strongly toward an engagement or decision-stage issue than a purely payment-processing issue.

Funnel Stage	Conversion	Business Interpretation
App Open → Paywall	82.8%	Largest early-stage opportunity
Paywall → Plan Selection	73.1%	Users are leaving before choosing a plan
Plan Selection → Payment	81.8%	Relatively stronger movement
Payment → Success	78.5%	Payment completion can still be improved

5. Segment-Level Findings

Platform performance is relatively close, but iOS leads at 40.7%, followed by Android at 38.5% and Web at 37.4%. The gap is not large enough to treat one platform as a standalone problem, but Web is the first area worth checking if the business wants to improve conversion.

Plan performance is also fairly balanced. Premium leads at 40.0%, followed by Basic at 38.5% and Standard at 38.0%. The small difference suggests that plan selection is not driven by one extreme outlier.

Returning users represent 38.2% of the user base, while new users make up the larger share. This gives the business a useful retention opportunity: understanding what brings returning users back and whether they convert at a higher rate can help improve customer value over time.

6. Payment Performance

UPI has the strongest payment success rate at 86.6%. Wallets follow at 85.3%, while Net Banking is the weakest at 79.5%. Credit Card and Debit Card sit between these two ends.

The immediate action should not be to remove weaker payment methods. Instead, the business should review failure reasons and the checkout experience for lower-performing methods. Keeping the full payment choice set while improving the weak points reduces the risk of losing customers who prefer a specific method.

Payment Method	Success Rate	Observation
UPI	86.6%	Strongest
Wallet	85.3%	Strong
Credit Card	80.9%	Mid-range
Debit Card	76.6%	Needs review
Net Banking	79.5%	Lowest in dashboard

7. Geographic View

The city map highlights where drop-off activity is concentrated geographically. The map should be used as a prioritisation tool rather than as proof of a city-specific cause. A high drop-off value in a city can be driven by a larger user base, so the next step should be to compare both drop-off amount and drop-off rate for the same city.

Recommended interpretation

Do not label the highest-volume city as the worst-performing city without checking its user base. A rate-based comparison is needed before making a city-level product or marketing decision.

8. Recommended Actions

01	Investigate the early funnel	Review the app-open to paywall and paywall-to-plan experience. Check whether users understand the value proposition, pricing and next step.
02	Break down the largest drop-off	Compare the weak funnel stage by platform, city, user type and plan to identify where the problem is concentrated.
03	Review payment friction	Analyse payment failure reasons, especially for lower-performing methods such as Net Banking and Debit Card.
04	Use returning users as a benchmark	Compare new versus returning users across conversion and payment success. This can show whether familiarity with the product improves conversion.
05	Prioritise by business impact	Use both user count and value at risk when deciding which problem to fix first. The biggest percentage drop is not always the biggest revenue opportunity.

9. Analysis Notes

The analysis is based on the cleaned event-level dataset and the Power BI measures used in the dashboard. Users are counted using unique user IDs, while conversion is treated as movement through the subscription journey. Revenue is based on successful payment events, and value at risk is based on failed-payment value.

The dashboard covers September 2026, as shown by the date filter. The figures should therefore be read as a period-specific view rather than a long-term trend. Before making a major product decision, the same analysis should be repeated across several months to confirm that the pattern is persistent.

10. Conclusion

The overall picture is positive, but there is a clear opportunity to improve the subscription journey. The strongest next step is to reduce early-stage user loss and then address the weaker parts of payment completion. Platform and plan performance are relatively balanced, so the data does not currently point to one platform or plan as the single source of the problem.

For the next analysis cycle, the focus should be on identifying the exact reason users leave the early funnel and quantifying the value associated with those users. That will turn the dashboard from a reporting tool into a practical decision-making tool.
